Intro

What MENISCUS?

Total Meniscectomy

No differences in outcomes!

NO EVIDENCE could be found to support the prevailing ideas that patients with presence of mechanical symptoms or certain meniscus tear characteristics or those who have failed initial conservative treatment are more likely to benefit from arthroscopic partial meniscectomy.

Prevalence of knee osteoarthritis features on magnetic resonance imaging in asymptomatic uninjured adults: a systematic review and meta- analysis

19% of patients over 40 years old had a meniscus tear (pooled prevalence range 13%-26%). Older age was associated with significantly more tears.

Arthroscopic partial meniscectomy was associated with an INCREASED RISK of developing radiographic knee osteoarthritis and NO CONCOMITANT BENEFIT in patient- relevant outcomes at 5 years after surgery

Loss of Cartilage

Physical Therapy Exercise Program

The literature provides relatively STRONG EVIDENCE that surgery DID NOT improve functional activity or reduce pain compared with the results with conservative treatment.
